

CLAIMS

- Sub
A2
1. An apparatus comprising:
 - (A) an image pickup device which picks up an object image;
 - (B) an instruction device which gives an instruction for causing said image pickup device to pick up an object image for photo-taking; and
 - (C) an evaluation device which, on the basis of
 - (i) a state of an object existing before said image pickup device picks up an object image for photo-taking in response to the instruction of said instruction device and
 - (ii) an object image picked up by said image pickup device for photo-taking, evaluates the object image.
 2. An apparatus according to claim 1, wherein said instruction device includes a shutter release switch.
 3. An apparatus according to claim 1, wherein said evaluation device compares a state of an object existing before said image pickup device picks up an object image for photo-taking with a state of an object determined from an object image picked up by said image pickup device for photo-taking.
 4. An apparatus according to claim 1, wherein said evaluation value detects a state of an object existing before said image pickup device picks up an object image

for photo-taking.

5. An apparatus according to claim 1, wherein said evaluation device determines a difference between a state of an object existing before said image pickup device picks up an object image for photo-taking and a state of an object determined from an object image picked up by said image pickup device for photo-taking.

6. An apparatus according to claim 1, wherein said evaluation device determines a difference between a state in distance of an object existing before said image pickup device picks up an object image for photo-taking and a state in distance of an object determined from an object image picked up by said image pickup device for photo-taking.

7. An apparatus according to claim 6, wherein said evaluation device determines a difference between a state in luminance of an object existing before said image pickup device picks up an object image for photo-taking and a state in luminance of an object determined from an object image picked up by said image pickup device for photo-taking.

8. An apparatus according to claim 7, wherein said evaluation device determines a difference between a state in color of an object existing before said image pickup

device picks up an object image for photo-taking and a state in color of an object determined from an object image picked up by said image pickup device for photo-taking.

9. An apparatus according to claim 7, wherein said evaluation device determines a difference between a state in color temperature of an object existing before said image pickup device picks up an object image for photo-taking and a state in color temperature of an object determined from an object image picked up by said image pickup device for photo-taking.

10. An apparatus according to claim 1, wherein said evaluation device determines a difference between a state in luminance of an object existing before said image pickup device picks up an object image for photo-taking and a state in luminance of an object determined from an object image picked up by said image pickup device for photo-taking.

11. An apparatus according to claim 10, wherein said evaluation device determines a difference between a state in color of an object existing before said image pickup device picks up an object image for photo-taking and a state in color of an object determined from an object image picked up by said image pickup device for photo-taking.

12. An apparatus according to claim 10, wherein said evaluation device determines a difference between a state in color temperature of an object existing before said image pickup device picks up an object image for photo-taking and a state in color temperature of an object determined from an object image picked up by said image pickup device for photo-taking.

13. An apparatus according to claim 1, wherein said evaluation device determines a difference between a state in color of an object existing before said image pickup device picks up an object image for photo-taking and a state in color of an object determined from an object image picked up by said image pickup device for photo-taking.

14. An apparatus according to claim 1, wherein said evaluation device determines a difference between a state in color temperature of an object existing before said image pickup device picks up an object image for photo-taking and a state in color temperature of an object determined from an object image picked up by said image pickup device for photo-taking.

15. An apparatus according to claim 1, wherein said evaluation device determines a state of movement between an object existing before said image pickup device picks up an object image for photo-taking and an object

66244-12150

determined from an object image picked up by said image pickup device for photo-taking.

16. An apparatus according to claim 1, wherein said instruction device includes a shutter release member, and said evaluation device detects a state of an object existing before said image pickup device picks up an object image for photo-taking in response to a first stroke of said shutter release member, and detects a state of an object from an object image picked up by said image pickup device in response to a second stroke of said shutter release member.

17. An apparatus according to claim 1, further comprising:

a display device which makes a display according to whether a difference between a state of an object existing before said image pickup device picks up an object image for photo-taking and a state of an object determined from an object image picked up by said image pickup device for photo-taking is not less than a predetermined value.

18. An apparatus according to claim 17, wherein said evaluation device changes said predetermined value in accordance with a photo-taking condition.

19. An apparatus according to claim 17, wherein

662427-94099450

said evaluation device changes said predetermined value in accordance with one of a flash photo-taking condition, a slow-shutter mode and an exposure compensation mode.

20. An apparatus according to claim 1, wherein, when having determined that a difference between a state of an object existing before said image pickup device picks up an object image for photo-taking and a state of an object determined from an object image picked up by said image pickup device for photo-taking is not less than a predetermined value, said evaluation device enables the object image picked up by said image pickup device for photo-taking to be prevented from being recorded in a recording device.

21. An apparatus according to claim 20, wherein said evaluation device changes said predetermined value in accordance with a photo-taking condition.

22. An apparatus according to claim 20, wherein said evaluation device changes said predetermined value in accordance with one of a flash photo-taking condition, a slow-shutter mode and an exposure compensation mode.

23. An apparatus according to claim 1, wherein, when having determined that a difference between a state of an object existing before said image pickup device picks up an object image for photo-taking and a state of

an object determined from an object image picked up by said image pickup device for photo-taking is not less than a predetermined value, said evaluation device prevents, in response to a predetermined instruction, the object image picked up by said image pickup device for photo-taking from being recorded in a recording device, and causes, if not receiving the predetermined instruction for a predetermined period of time, the object image picked up by said image pickup device for photo-taking to be recorded in the recording device.

24. An apparatus according to claim 23, wherein said evaluation device changes said predetermined value in accordance with a photo-taking condition.

25. An apparatus according to claim 23, wherein said evaluation device changes said predetermined value in accordance with one of a flash photo-taking condition, a slow-shutter mode and an exposure compensation mode.

26. An apparatus according to claim 1, wherein said apparatus includes a camera.

27. An apparatus according to claim 1, wherein said apparatus includes an optical apparatus.

28. An object image evaluating method, comprising a step of:

in response to an instruction for causing an image pickup device which picks up an object image to pick up an object image for photo-taking, on the basis of (i) a state of an object existing before said image pickup device picks up an object image for photo-taking and (ii) an object image picked up by said image pickup device for photo-taking, evaluating the object image.

29. A computer program product, comprising a content of:

in response to an instruction for causing an image pickup device which picks up an object image to pick up an object image for photo-taking, on the basis of (i) a state of an object existing before said image pickup device picks up an object image for photo-taking and (ii) an object image picked up by said image pickup device for photo-taking, evaluating the object image.

30. An apparatus according to claim 1, wherein said evaluation device detects, by using said image pickup device, a state of an object existing before said image pickup device picks up an object image for photo-taking.

31. An apparatus according to claim 1, wherein, according to whether or not a difference between a state of an object determined from an object image picked up by said image pickup device for photo-taking and a state of an object existing before said image pickup device picks

control of
